

What should happen before the trip?

ADVISOR RECOMMENDATION

Requesting access documents is the necessary first diligence step, as this will determine whether a field review has a defined purpose. While the most significant evidence gap relates to the usability of mapped water features for livestock, the access file is the prerequisite for any on-site investigation.

THE ADVISOR'S READING

Request the access file before booking travel. If the file supports a mapped entrance, use the visit to inventory mapped water leads and clarify their usability for livestock. The map has already narrowed the job: use title to check the mapped road contact, then make the site visit a focused water-inventory day. Keep additional forage interpretation behind those two steps.

Mireye recognized 4213 Nambe Road, Indian Hills, CO 80454. You confirmed one outline. Federal evidence on this brief is clipped to that polygon. Mireye property, land, and hazard rows are context only - not parcel-wide proof.

VISIT PURPOSE

The trip depends on access documentation. If the entrance basis holds, the visit has a defined purpose: inspect mapped water areas and any seller-claimed infrastructure.

If the access paper holds, the next spend is the water walk. If the seller cannot show an entrance basis, pause the trip and give title the question. Either way, do not convert the RAP number into a herd size.

Do the cheap work before the expensive trip

MY READ

Request the access file before booking travel. If the file supports a mapped entrance, use the visit to inventory mapped water leads and clarify their usability for livestock.

START AT THE DESK

Ask title or the listing side for the access paper: deed, easement, or recorded entrance. Do this before booking travel; the response gives the visit a defined job.

THEN GIVE THE TRIP ONE JOB

If the access documents support a defined entrance, use the field review to inventory mapped water leads and clarify their usability for livestock.

DO NOT SPEND TWICE

Hold additional forage interpretation until the entrance file and water-focused visit show which analysis is worth buying next.

The public layers have already done their job: they set the order. The next useful evidence comes from the file, then the ground.

Let the first result change the story

Access documents are prioritized because they determine whether a field review can proceed with a defined purpose. Without a documentary basis for entrance, further diligence on water or forage cannot be actioned on the ground.

This can be requested before travel and determines whether the visit has a defined job.

Ask for a usable water location or build a field inventory; mapped identities cannot be drawn yet.

Visible conditions on one date still do not establish year-round reliability, quality, capacity, or rights.

IF THE FILES HOLD

If the access documents support a defined entrance, use the field review to inventory mapped water leads and clarify their usability for livestock.

IF THEY DO NOT

If the access documents do not support a defined entrance, pause further diligence spending and consult with title or counsel for clarification.

COPY-READY REQUESTS

TITLE / OR / COUNSEL

Please confirm whether the mapped road contact is a recorded legal entrance, and whether title, easements, or exceptions support or limit access at that location.

PARTNER

We have mapped hydrography identities, but no drawable location yet. Please send a usable location or help us build a field inventory. Do not treat a catalog identity as a pin or as a drinker.
